Hey all - here I am spamming for my Casio SK-1 auction. This isn't your father's SK-1 (but he called and man, he is pissed). Take a look:

Raising money for other gear, of course. Also, I have used and sampled it for two years so I have enough material from it to last me for a while. As bent Casios go, it's among the finest performance-oriented instruments out there. The tilt control is damned cool as well. When the SK-1 is run into the Monomachine inputs, that's where the control comes in. Circuit bent goodness combined with envelope control is the best.

On my Monomachine, I have this running into Input 1:

And this one running into Input 2:

wow, that's cool as hell...did you design the bends yourself? Is it really complicated, or relatively simple? Don't give away any trade secrets, or anything...
