
Attention Synth Builders/Soldering experts

Posted by sensorium - 2006/08/15 15:00

Rudi Lindhard is currently adding the LAMM upgrade to my MemoryMoog in Germany. As I requested, he has e-mailed me a diagram for modifications that can be made to a Elektro Harmonix Small Stone Analog Phase Shifter, giving it the ability to be controlled by the CV LFO of the Moog. Is anyone willing to take a look at this diagram? It's nonsense to me, although he claims it's quite easy. I have 2 Small Stone's I would like modified so that I can process the stereo signal of the LAMM. I'm willing to pay for this obviously if anyone is up for the task ;)

The idea of a LAMM going through LFO controlled Small Stone's makes my balls smile.

While we're on the topic. Does anyone know if it's possible to MIDI a Small Stone?

Thanks!

Thanks!

yes, when you have the cv mod. just add a midi2cv converter and you're ready to phase your ass off ;)

post it.

I'll look it over

hey sensorium :]

i couldnt get that link to work.. any chance of a re-post or can email these schematics?

i would love to CV my smallstone too!!!!!!!!!

rgds

thats a piece of cake - you need to cut one trace, put that resistor in there (cost of 10 cents) and wire it up to a 1/4" jack with the ground going to the other ground points.

you can do this easily yourself!

You are overestimating my electronics expertise. I wouldn't even know how to find the other ground points. Surely you could use some extra \$\$\$\$ to do this simple mod? What do you say?
